E-Operation
Functional Requirements Overview

A consolidated view of the delivered and agreed functional scope for CRM, contract operations, billing, and reporting.

Purpose
Provide a practical reference for what the E-Operation module currently supports and where the remaining scope begins.

Operating principle
Permissions, responsibility, and audit history follow the real operational role at every workflow stage.

1. Administration foundation

- User management supports creating, editing, enabling, and disabling user accounts.
- Role management provides a clean permission-management page while preserving protected system roles.
- User-zone assignments support operational scope and the availability of technicians for installation work.
- Contract types and promotional offers are managed dynamically rather than being hard-coded in the application.
- Navigation is permission-aware through the app, module, and page model.

2. Contract and customer operations

- The Add Contract journey captures customer, address, contact, tax, geographic, plan, payment, additional-service, and hardware details.
- Customer codes are automatic. Contact data includes mobile and Egyptian landline handling, while documents and location details are retained with the customer record.
- Date inputs and reports use a day/month/year presentation for operational consistency.
- The contract master file and follow-up views expose the expanded operational fields in a tabular format.
- Every important edit and workflow change is tracked in System Actions, including readable From and To state values.

3. Contract workflow

The implemented responsibility chain is shown below. Stage notes are stored separately so operational context is retained with the correct stage.

Workflow stage	Responsible role	Key responsibility
Under Checking	Call Center	Review contract, add notes, and edit customer information.
Pending	Operational Manager	Approve or reject the contract; rejection requires a reason; customer information can be edited.
Under Installation	Technical Support Manager	Assign or reassign a zone-eligible technical representative for installation.
Installed	Assigned Technical Representative	Complete installation and enter the manual activation code.
Activated	Call Center	Confirm activation and close the operational workflow.

UNDER CHECKING	PENDING	UNDER INSTALLATION	INSTALLED	ACTIVATED

If activation fails, the contract returns to Under Installation. The previous technician assignment is cleared so the Technical Support Manager deliberately assigns the next installation owner.

4. Additional-service requests

- A requester first selects any active zone, then sees the contracts in that zone. Zone access is intentionally not restricted.
- Requests support additional units, replication, and hardware lines, plus operational notes.
- The Operational Manager approves or rejects the request. Rejection requires a reason.
- Approval creates the invoice; collection of that invoice is intentionally a later process.

5. Billing and collection safeguards

- Initial contract financial records are created when the contract is created, not when it is approved.
- Selected subscription months are represented explicitly and validated so required month amounts are paid correctly.
- The payment flow defaults to the remaining amount and prevents aggregate overpayment.
- Additional services and replication follow their own paid service handling; hardware is invoice-only and is excluded from add-on collection validation.
- Payment methods, cheque details, invoices, receipts, and allocation rules are integrated with the contract flow.

6. Operational reporting

The reporting surface is designed around the data captured during contract creation and execution.

Report / view	What it provides
Contract master file	Expanded contract, customer, address, geography, implementation, notes, and workflow data.
Contract follow-up	Master-file-like contract table with the relevant workflow actions for the user role.
Rejected contracts	Dedicated view of rejected contracts and their rejection context.
System Actions	Auditable edits and status transitions shown with readable From and To values.
Operational sales and collections	Sales, collection, additional-units, replication, and related operational measures.
Targets / scoped work	Activated contracts are visible as targets for the applicable technical-representative zones.

Reports support export where implemented and use the same date convention as the operational screens.

7. Explicitly deferred scope

Not yet implemented	Refunds have been discussed as a financial-control dimension, but their workflow, authorization, accounting treatment, and user interface are not implemented yet. Collection for invoices created by the new additional-service request approval flow is also deliberately deferred.

This document describes the agreed functional behavior. It is intended as an operational baseline for testing, training, and future scope decisions.
